Drop test for CO-hemoglobin with copper sulfate. G. A. Stepanskii (I. P. Pavlov Med. Inst., Ryazan). *Laboratornoe Delo* 11, No. 3, 33-34(1965).—One drop each of suspected and normal blood are deposited on a white-surface paper or porcelain and mixed with a drop of 2% $CuSO_4$. Results are read after ½-1 min. Control has the appearance of a gray brownish or chocolate-brown pasty mass. The suspected blood sample, having CO-hemoglobin but the same consistency but the color is raspberry-red, turning dark-brown on standing. When the blood contains less than 100% the color is a blending of red and brown. The more CO-hemoglobin the more the red color predominates. Limit of sensitivity is 5%. Control is unnecessary when more than 50% CO-hemoglobin is present.

1112. THE PATHOGENESIS OF HAEMOLYTIC ANAEMIA OF TOXIC ORIGIN (Russian text) - Stepanskiy G. A. Med. Inst. Pavloff, Ryazan - ARKH. PATOL. 1956, 18/3 (30-36) Graphs 2 Tables 4

When rabbits poisoned with AsH_3 are given narcotic doses of chloral hydrate (0.25 g. per kg.) or sodium amytal (0.025 g. per kg.) the globular resistance is decreased much less than in control animals also poisoned with AsH_3, 20-30 min. previously; it is particularly the resistance against the lowest percentage of NaCl solutions which is influenced. On the other hand, administration of Na amytal in doses of 0.1 g. per kg. increases the degree of lowering of globular resistance. Administration of 0.25 g. per kg. Na amytal 6 hr. after the poisoning when haemolysis begins, not only does not decrease the degree of lowering of globular resistance, but even increases it. 0.1 g. per kg. Na amytal induces in rabbits a condition very near anaesthesia: it delays the development of haemolytic anaemia, but also the regeneration of red cells. Administration of 0.5 g. per kg. chloral hydrate increases the development of haemolytic anaemia. Administration of 0.025 g. per kg. Na amytal 6 hr. after the poisoning caused in the first group: in 48 hr. in some animals retardation of the development of haemolytic anaemia, followed by enhancement; in the second group: in 24 hr. a marked effect on the development, accelerating and increasing globular destruction. Administration of 0.25 g. per kg. chloral hydrate to white mice 20-30 min. after poisoning them delayed the development of haemolytic anaemia; 6 hr. later, however, it enhanced it. Introduction of the narcotic substance soon after poisoning exerts a distinct influence on haemolytic anaemia and on erythropoiesis during the whole period of illness. The fact that this action is exerted via the central nervous system was proved with the aid of trauma of the animals' heads or repeated knocking on the head: a distinct increase of erythrocytes and of the Hb content ensued; no variations of globular resistance. Cranial trauma in poisoned rabbits delays the development of haemolytic anaemia. It is obvious that narcotic doses of chloral hydrate (0.5 g. per kg.) or of Na amytal (0.1 g. per kg.) do not interrupt the pathological reflex arc, but only modify the trophic manifestations of the central nervous system.

AUTHORS: Unkov, Ye. P. and Stepanskiy, L.G.

TITLE: Calculation of the bimetal tube pressing process

PERIODICAL: Kuznechno-shtampovochnoye proizvodstvo, no. 3, 1962, 3-8

TEXT: The results of research on the pressing of bimetal tubes, conducted by the authors at TsNIITMASh in 1960, are given. The derived calculation formulas for determining the necessary dimensions of tube billets, the required pressing force and the press capacity are also presented. The experiments consisted in pressing 18 x 3, 18 x 2, 16 x 2 and 15 x 1.5 mm bimetal tubes, clad with a 0.2 - 1.2 mm metal layer on the outside or inside, in a 400-t vertical hydraulic press. A container, 40 mm in inner diameter, was used. Armco iron and steel grades ЭИ612 (EI612), 1Х18Н9Т (1Kh18N9T), ЭИ 852 (EI852), ЭИ 847 (EI847) and 45 were used. Billets were prepared by turning forged metal rods, pickling them to remove oxide films, assembling them into bi-layer billets by pressing, and finally heating them for pressing

Calculation of ...

in a barium chloride bath after preheating to 750-800°C in an induction furnace. The container was preheated, and a mixture of graphite with machine oil used for lubricant on the container and die surfaces. The tube mandrel was lubricated with 20A (20A) glass powder of the Gosudarstvennyy institut stekla (State Glass Institute) dissolved in commercial water glass. The fluid pressure in the cylinder and the time of movement of the press slide were oscillographed. The conditions resulting in a steady pressing process are given in formulas for cases when (1) metal of higher strength is in the external layer, and (2) is on the inside. The recommended sequence of calculation using these formulas is given. O.A. Yegorychev, A.A. Mishulin and A.A. Sokolova took part in the experiments. There are 7 figures, 1 table and 6 references: 4 Soviet and 2 non-Soviet-bloc. The English-language reference is: "Materials in Design Engineering", 1958, 38, no. 7, 91-93.

ORIG. PUB. : Izv. Otd. estestv. nauk AN TadzhSSR, 1957, No. 21, 89-107

ABSTRACT : In contradiction of the established viewpoint on the nature of wilt in the cotton plant, the author expresses the opinion that the cause of the wilting was not fungi but special unfavorable meteorological conditions, and he considers the implantation of fungi on these plants to be a secondary factor. Wilt can be produced by a high critical temperature (higher than 38.7 degrees) with low humidity and

Some polycyclic homologs of naphthalene and tetralin. E. S. Pokrovskaya and T. G. Stepantseva. *J. Gen. Chem.* (U. S. S. R.) 9, 1953-60(1939).—Some condensation products of cyclohexene (I) with naphthalene (II) and tetralin (III) in the presence of $AlCl_3$ are described. To a soln. of 200 g. II in 60 g. CS_2 are added slowly while stirring and cooling 26 g. anhyd. $AlCl_3$ and an equimol. amt. of I. The stirring is continued for 15-20 mins., the reaction mixt. is treated with H_2O, and CS_2 distd. off. The benzene ext. of the reaction products is treated with HCl and alkali, dried and distd. From the fraction b_3 170-80°, β-cyclohexylnaphthalene (IV), m. 31°, d_4^{20} 1.0074, d_4^{50} 1.0049, n_D^{20} 1.5925, ... 0.07187, ... 0.00019, ... 0.02352, is isolated whereas the fraction b_3 154-6° consists of a mixt. of IV and another liquid hydrocarbon (V). Fraction b_3 190-230° gives dicyclohexylnaphthalene (VI), m. 150-1°, and a liquid isomer, b_3 203-6°, d_4^{20} 1.0399, d_4^{50} 1.0252, n_D^{20} 1.6019, n_D^{50} 1.5046, ... 1.0740, ... 0.8200, ... 0.1525. Fraction b_3 230-70° gives tricyclohexylnaphthalene, m. 121-2°, and fraction b_3 270-320° gives tetracyclohexylnaphthalene, m. 290°. Dehydrogenation of the mixt. of IV and V gives 2-phenylnaphthalene, m. 97-8°, V thus being either α-cyclohexylnaphthalene or methylcyclopentylnaphthalene. Dehydrogenation of VI gives a new diphenylnaphthalene, m. 290°. To 200 g. III in CS_2 are added 20 g. $AlCl_3$ and 40 g. I while cooling. The reaction product after appropriate treatment is subjected to fractional distn. Fraction b_3 145-70° gives cyclohexyltetralin (VII), b_3 147°, d_4^{20} 0.9801, d_4^{50} 0.9630, n_D^{20} 1.5400, n_D^{50} 1.5120, ... 0.8510, ... 0.1800, ... 0.0801, ... 0.0437, ... 0.0658. Fraction b_3 168-200° contains dicyclohexyltetralin, consisting probably of 2 or more isomers. Hydrogenation of VII in the presence of a Pt catalyst at 170-80° gives a mixt. of α- and β-cyclohexyldecalin, the mixt. showing $b_{1.5}$ 130-41°, d_4^{20} 0.9338, d_4^{50} 0.9354, n_D^{20} 1.5018, ... 0.4708, ... 0.0351. The cyclohexyl derivs. of II, III and decalin prepd. when subjected to the action of H_2SO_4 react more or less readily with the formation of sulfurization products. IV, VI and VII are easily sol. in aniline at room temp. O. B.

Thermal solution of coal and hydrogenation of coal solutions. III. M. K. D'yakova and T. G. Stepantseva. *J. Applied Chem.* (U. S. S. R.) 13, 1189-98 (in French, 1198)(1940); cf. *C. A.* 33, 8864.—The humic coals of Cheremkhovo, Kuibass, Mushov, Chelyabinsk and also Verkhne-Suifun rhabdopinite deposits, can be dissolved in an anthracene oil or primary tar to the extent of 40–50% by wt. of org. substances of coal, but the soln. proceeds much slower and to a lower degree than with anthracite coal or combustible shale. The soln. of org. substances of coal becomes noticeable at 325°; the optimal temp. for most complete and rapid soln. is 400-20°. On prolonged heating at 400° or higher, the dissolved coal ppts. The sol'y. of Cheremkhovo coal increased in the presence of H (an initial pressure of 10 atm.). The Kuibass and Verkhne-Suifun coals were most easily and completely (to 55-65%) dissolved (than other coals) at 400-10° for 15-30 min. with 2 parts of solvent per part of coal without change of solvent.

STEPANTSEVA, T. G., NAMETKIN, S. S. and POLKOVSKAYA, Ye. S.

"Hydrocarbons of the Naphthalene Series in Surakhany Petroleum," Dokl. AN SSSR, 67, No.5, 1949

Prepared naphthalene and its methylate homologues (beta-methylnaphthalene and 1,6-dimethylnaphthalene) from the kerosene fractions of light Surakhany oily petroleum by a method developed in Rumanian oil fields. Added picric acid to fractions of this highly aromatic kerosene (specific weight, $d_4^{20} = 0.8432$ and coefficient of refraction, $n_D^{20} = 1.4680$) in an ether solution. Isolated the naphthalenes in subsequent "boiling off" stages, in temperature ranges of from 190° to 252° C -- naphthalene itself in the lowest ranges and 1,6-dimethylnapht alone in the highest. Pictates are by-products of the processes. Submitted 13 Jun 49.

Hydrocarbons of the cyclohexylindan series. L. S. Pokrovskaya and T. G. Stepantseva. *Trudy Inst. Nefti, Akad. Nauk S.S.S.R.* 1, No. 2, 307–9 (1950).—Alkylation of indan (I) with 0.5 mol. equiv. of cyclohexene (II) in the cold and in the presence of anhyd. $AlCl_3$ yielded 5-cyclohexylindan, b_3 130–1°, m. 2.5°, d_{20} 0.9877, d_{20} 0.9307, n_D^{20} 1.5460, max. aniline point <−10° (III) and 5,6-dicyclohexylindan (IV), b_3 178–9°, d_{20} 1.0011, d_{20} 0.9458, n_D^{20} 1.5510, max. aniline point 9°. Equimolar reaction of I and II yielded more IV and tricyclohexylindan (V) (probably the 4,5,6-isomer) white crystals, m. 115° (from acetone). IV, glasslike, began to crystallize on standing 6 months. Abs. centipoise and kinematic centistoke viscosities data are given for III and IV at temps. from 20 to 100°. III with H_2SO_4 gave the corresponding sulfonic acid. I was prepd. in good yield and free from hydroindan by passing indene and H through an open tube at 215–20° contg. a Ni catalyst which in turn was prepd. by reducing NiO at 380°. A comparison of III and IV with analogous cyclopentyl derivs. of Tetralin shows that the indan compds. have a lower d. and n, but a higher viscosity. J. A. K.

"The Content of Hydrocarbons of the Naphthalene Series in Maykop, Tuymazy, and Dossor Crudes," Acad S. S. Nametkin (deceased), Ye. S. Pokrovskaya, T. G. Stepantseva.

"Trudy Inst Nefti" Vol 2, pp 10 - 16

The kerosene fraction from Maykop crude (tertiary deposits) contains considerable quantities of naphthalene, 3-methylnaphthalene, 1,6 and 1,7-dimethylnaphthalenes, trimethylnaphthalenes, higher homologs of naphthalene, and other polycyclic hydrocarbons of a more complex structure. The kerosene fraction of Tuymazy crude (Devonian deposits of Second Baku) does not contain napthalene itself, but some of its homologs. These homologs are precipitated as picrates together with polycyclic sulfur compds when the picric acid method of sep is used. The kerosene fraction of Dossor crude (Jurassic deposits, Emba region) does not contain noticeable quantities of naphthalene or its homologs.

TITLE: The Synthesis of Alkylindanes (Sintez alkilindanov)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 119, Nr 6, pp. 1164-1166 (USSR)

ABSTRACT: In order to begin the complicated investigation of the composition of the petroleum and mineral oil fraction with regard to hydrocarbons, first of all, hydrocarbons in a pure state are to be produced and universally studied, which correspond to the mentioned fractions according to their boiling. Among the possibly occurring aromatic hydrocarbons the indanes are entirely insufficiently investigated. Then follow some examples of the hitherto known data on this subject (Ref 1). In order to complete these informations the authors tried the synthesis of the indanes for the purpose of obtaining preparations for spectral analysis. Those were, above all, the substances menticned in the title with aliphatic substituents in the aromatic ring. A survey of publications

TITLE: Synthesis of polycyclic naphthenic hydrocarbons

SOURCE: Neftekhimiya, v. 5, no. 3, 1965, 320-321

TOPIC TAGS: hydrocarbon, polycyclic compound, synthesis property, cyclic hydrocarbon

ABSTRACT: In the present work, which is a continuation of an earlier investigation, nine polycyclic naphthenic hydrocarbons (not previously described in literature) were synthesized. Most of these hydrocarbons are the homologs of 1.1-dicyclohexyl ethane and are regarded as model hydrocarbons of the medium oil fractions. Some of them were obtained by hydrogenating the aromatic hydrocarbons described by E. M. Terent'yeva, P. I. Sanin, T. G. Stepantseva, M. M. Kusakov, N. A. Shimanko, and V. I. Sidorenko (Neftekhimiya, 1, No. 2, 141, 1961); the others were obtained by the condensation of styrol with mesitylol and cumene. From 20 to 50 g of hydrocarbon and 10% of a nickel catalyst were hydrogenated at 200C and at the initial hydrogen pressure of 130 atm. After each experiment, the autoclave was cooled to room temperature, the pressure was lowered to normal, the product removed, and the autoclave washed with alcohol which was then added to the product. Subsequently,

Card 1/2

L 62033-65
ACCESSION NR: AP5016837

the catalyst and alcohol were separated from the product, which was dried over calcium chloride and tested by the formolite reaction which indicates the absence of aromatic hydrocarbons. Finally, it was purified by multiple distillation. The characteristics of the bi-and tricyclic hydrocarbons obtained are tabulated. Orig. art. has: 1 table.

Title : The Use of New Pharcacological Procedures in Arteriography.

Orig Pub : Biul. ekspeim. biol. i meditsiny, 1955, 40, No 11, 77-79

Abstract : It was demonstrated by tests on an isolated rabbit ear that the vascular constriction due to Sergosine (I) administration is largely connected with its peripheral effect. Rabbits and cats under ether anaesthesia were injected with 3-4 ml of a mixture of I with a 1-3% solution of papaverine into the aorta. Good arteriograms were obtained. The use of Na-nitrite (0.5 ml of 10% solution) was less effective. Histamine cannot be used in arteriography, because it raises vascular permeability and produces a diffusion of the contrast material into the surrounding tissues. Cardiotrast (50% solution) produces a slight spasm of the vessels.

Title : Method of Evaluation of Some Data Which Characterizes the Capacity of a Vascular Channel.

Orig Pub : Izv. Akad. ped. nauk RSFSR, 1957, vyp. 84, 175-176

Abstract : For the objective measurement of the thickness of a vascular channel on a roentgenogram a direct line is drawn that intersects the image of all of the vessels that proceed through the diameter of the organ in the given instance. The number of vessels is computed, and with the ocular micrometer the diameter of the lumen of each of them is measured; after this, the area of the transverse section of the vessels is found. Considering the area of the diameter of the organ itself, one can obtain an idea of the thickness of the vascular network and of the capacity of the vascular channel.

TITLE: Biomechanics of human movements in free space

SOURCE: Aviatsiya i kosmonavtika, no. 7, 1965, 48-53

TOPIC TAGS: astronaut training, skeletal mechanics, astronaut human engineering, space physiology

ABSTRACT: As a result of the many queries submitted by readers of Aviatsiya i Kosmonavtika (Aviation and Cosmonautics), the biomechanics involved in human maneuvers in space is explained in detail. A history of the physical theories involved is considered, beginning with Delone (1862) and proceeding through Kirpichev (1907), Pol' (1930), Kotikovaetal (1939), and Ivanitskiy (1948).

Figure 1 depicts the interaction of two parts of a body in an unsupported state. The proportion derived from the diagram is:

$$\frac{a_1}{a_2} = \frac{J_2}{J_1}$$

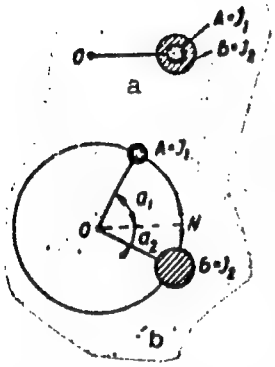

Fig. 1. Interaction of two parts of a body in an unsupported state during muscular movement: a-position of body parts prior to interaction. b-position of body parts a few moments after the beginning of the interaction

Card 2/7

L 63633-65

ACCESSION NR: AP5017033

Thus the angular rate of interacting body parts is inversely proportional to their moments of inertia. Figures 2, 3, and 4 show the types of exercises employed to facilitate adaptation to an unsupported condition. The results of studies involving the exercises shown in the figures lead to the conclusion that man can quickly and accurately orient his body position in a free-space condition without having to use any mechanical means. However, propulsion devices located on the back at the center of gravity and at the shoulder level will most likely be used, and their effectiveness will be enhanced by means of the physical training procedures described. In any case, the article points out the necessity for special terrestrial training procedures to prepare man for free-space maneuvers. The Zhukov turntable is regarded as the best means of conditioning turning movements in space. Also useful for conditioning free-space maneuvers are acrobatics and especially swimming exercises combined with parabolic flights in aircraft where actual free-space operating procedures can be practiced and perfected. The author asserts that others will follow Leonov into space to build manned orbital stations, live on them, and ultimately participate in Moon, Mars, and Venus missions.

TITLE: Orientation in unsupported space

SOURCE: Aviatsiya i kosmonavtika, no. 11, 1965, 36-38

TOPIC TAGS: weightlessness, cosmonaut training, space flight simulation

ABSTRACT: In response to letters from readers requesting more details on an article published earlier, the authors present details on the moments of inertia of separate parts of the human body in various positions in unsupported space. A description is given of experiments performed to gain more information on the motor activity of man subjected to a longer (average 30 sec) period of weightlessness, created by an aircraft flying in a Kepler parabola. These experiments confirmed earlier theoretical and experimental data on the different methods of orientation (turning) of man by internal forces around three mutually perpendicular axes of the body. Some of the procedures used by the subject for turning in different

Card 1/2

L 9588-66
ACC NR: AP6000255

directions are described. A study was also made on the most effective way of using support (pushing with the hands or pulling) for aimed displacement in a prescribed direction. Pulling proved to be the simplest, most convenient, and most accurate method of displacement, with minimal twisting of the body. Some other considerations which should be taken into account in selecting the scheme and the design of individual means of movement in weightlessness are discussed. Orig. art. has: 1 figure.

TITLE: Biodynamics of extravehicular activities

SOURCE: International Astronautical Congress. 17th, Madrid, 1966. Doklady. no. 6. 1966. Osnovy biomekhaniki cheloveka v bezopornom polozhenii, 1-4

TOPIC TAGS: EVA, astronaut orientation, spatial orientation, extravehicular movement, manned space flight

ABSTRACT:

Extravehicular activity during weightlessness requires a total readjustment of coordination and reallocation of motor effort, and the modification of existing motor habits or the development of new ones. EVA away from the ship and without interaction with objects outside the body requires even more drastic modification of motor activity. Early attempts at the solution of the problem of maneuvering the body under these conditions by Kirpichev (1907) and Pol' (1930) are cited. Maneuvering the unsupported, weightless

Card 1/3

ACC NR: AT7011644

body by movements of the extremities depends primarily on the quantitative characteristics of interaction of the different parts of the body, and on anatomical considerations. The authors have computed the moments of inertia of the body and various extremities (head, arms, and legs) in various positions (bent, straight) and combinations for a man 168--172 cm tall weighing 70-75 kg. The authors propose the following maneuvers: 1) to rotate the body around its long axis, both arms are swung in a plane perpendicular to the axis of rotation. One such movement turns the body 60°. The arms are returned to the starting position through a plane parallel to the axis of rotation. Leg movements (initial position with the legs spread wide) are even more efficient, turning the body 160° or 90°. "Yawing" and "pitching" rotations (about a transverse or a front-to-back axis through the body's center of gravity) are accomplished by circular movements of both arms in the sagittal plane, or of one arm in the frontal plane. Initial results indicate that a properly trained person can maneuver his body into any desired position quickly and accurately without the use of any outside equipment (thrusters, etc.) or support.

TITLE: The cubic meson telescope of the Crimean astrophysical observatory of the AS USSR

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1961, 80, abstract 8B388 ("Izv. Krymsk. astrofiz. observ., no. 24, 1960, 313-319, English summary)

TEXT: A cubic telescope for continuous registration of the hard component of cosmic rays is described. The telescope consists of three horizontal rows of ГС-60 (GS-60) Geiger-Müller counters connected in a coincidence circuit and separated from each other by 10 cm of lead for absorption of the soft component. Continuous registration of cosmic particles makes heavy demands on the operating stability of the telescope and the useful life of the counters. Their useful life was lengthened by means of quenching of discharge in the counters with the aid of a special electronic circuit. Quenching of discharge made it possible to reduce discharge time by a factor of 5-6 and lengthen the useful life of the counters to 10-12 months. A short description is given of the electronic circuits used in the set-up.

TITLE: Some questions of the theory of the effect of magnetic storms in cosmic rays (Forbush effect)

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 6, 1962, 13, abstract 6G65 (Izv. Krymsk. astrofiz. observ., 25, 1961, 268-276)

TEXT: The author investigates the effect in cosmic rays when the earth strikes a corpuscular flow, having the form of a magnetized shell. The flow is ejected over a wide solid angle; its angular flare in the plane of the elliptic is ~90°. The force lines of the regular magnetic field frozen into the flow emerge from, and revert to, the sun's active region. Within the cavity the plasma is turbulent and represents separate clounds with a chaotic field. The earth's capture by a corpuscular flow leads to a reduction in the intensity of cosmic rays, and the variation spectrum is described by the expression:

Card 1/3

Some questions of ...

$$\frac{\sigma D(E)}{D(E)} = \frac{2}{\pi^2} \int_0^{\pi/2} \text{arc cos} \left(1 - \frac{E_0}{E \cos\theta}\right) \cos\theta \cdot d\theta$$

Here E is the particle energy, E_0 = 300 Hl, H and l are the field's intensity and the thickness of the regular field's layer, and θ is the angle between the direction of the vector of the velocity of primary particle movement and the perpendicular to the field intensity vector. It is shown that the spectrum's character does not change when there are irregularities in the regular field. Estimates are made of the ratios of the Forbush-effect amplitudes for various secondary cosmic-ray components. The relation of the amplitude of Forbush reductions to the local time (the effect's anisotropy) is calculated for hard and neutron components. It is shown

TITLE: Investigation of Forbush effect. II. Energy spectrum of variations. Relation of spectrum to the form of drop and duration of effect

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 6, 1962, 58, abstract 6A432 ("Izv. Krymsk. astrofiz. observ.", 1961, v. 26, 136 - 143, English summary)

TEXT: Characteristics of Forbush effect were studied on the basis of data from stations of cosmic radiation. The method used was determination of global intensity of the nucleon and meson components of cosmic radiation. Spectrum of variations during the Forbush effect was investigated using characteristics obtained from the global intensity. It is shown that spectra of variations must satisfy the requirement of the constancy of energy dependence, both from case to case and during the period of intensity drop. An approximate dependence of duration on amplitude has been found. Under some assumptions (see § 5) it turns out that the form of duration-versus-amplitude relation is determined by spectrum of

TITLE: Some properties of anisotropy during the Forbush-effect

PERIODICAL: Geomagnetizm i Aeronomiya, v.2, no.3, 1962, 443-452

TEXT: The anisotropy of decreases in the cosmic ray intensity during sudden magnetic storms is analyzed. Data of 14 cases collected in the course of an IGY were used. The amplitudes were obtained for the anisotropy of the nucleonic and hard components before the sudden beginning, during the storm, and in the course of several days after it. The analysis confirms that the anisotropy of the Forbush decrease is a consequence of the diurnal effect. Conclusions: 1) The anisotropy during a Forbush effect is explained by the increase of the diurnal variations. 2) In some cases a change in the phase and a decrease in the amplitude of the diurnal variations was observed after the beginning of a magnetic storm (in 3 out of 14 cases). 3) The spectrum of the diurnal variation during a Forbush effect is on the average the same as in absence of a magnetic storm. The

Card 1/2

Some properties of anisotropy...

average ratio of the amplitudes of the neutron and the hard components is 1.31±0.08, but the differences between individual cases can be large: from 0.85±0.12 up to 1.60±0.13. 4) The anisotropy amplitude reaches its maximum, as a rule, during the first 24 hours after the sudden beginning of the magnetic storm. 5) The spectral properties of the anisotropy during a Forbush effect can be explained by Dorman's theory, but with a slight change in the meaning of the cut-off momentum P_m. TITLE: The total number of high energy particles ejected during the flare of May 4, 1960

SOURCE: Akademiya nauk SSSR. Krymskaya astrofizicheskaya observatoriya. Izvestiya. v. 27, 1962, 178 - 181

TEXT: On May 4, 1960, between 10.15 and 11.05 UT a flare of class 2+ took place on the Sun. The flare was accompanied by increasing intensity of cosmic rays. Analyzing the observational data and assuming independence of diffusion coefficient of coordinates and time, the author determines the following quantities: The diffusion coefficient $D = 0.7 \times 10^{23}$ $cm^2.sec^{-1}$ and the time of ejection $\Delta t = 7.5$ min. For the total flux of particles the expression $Q \approx 10^{31} I_{max}$ is derived, where I_{max} is the maximum flux in a small solid angle (approximately 1 steradian). This yields $Q = 10^{33}$ particles. The total energy of particles with $E > 1.5$ Bev is approximately 10^{30} erg. The conclusion is drawn that the particles were ejected during the initial stage of the flare; this is of im-

TITLE: On the problem of the variation spectrum during the Forbush effect

SOURCE: Akademiya nauk SSSR. Krymskaya astrofizicheskaya observatoriya. Ivestiya, v. 27, 1962, 182 - 193

TEXT: The problem of spectrum of variations is very important in studying the modulation of cosmic ray intensity, since the spectrum indicates the mechanism of effect. In the present article the author considers the spectrum of the Forbush effect. Several mathematical expressions for the Forbush effect spectrum are presented and discussed, but only three of them are theoretically calculated and compared with experimental data: 1) The spectrum of the type $\frac{1}{\pi}\arccos\left(1-\frac{P_0}{P}\right)$; 2) $\frac{\delta D}{D}=\frac{P_0}{P}$, and 3) the spectrum of variations generated by the effect of an electrical field. In order to compare the calculations with experimental data, the ratios of amplitudes of effect on various instruments were calculated, such as neutron monitor at sea level, neutron monitor at a

On the problem of the variation spectrum...

level of 680 g/cm^2, cubic telescope at sea level, and the primary flux for the given parameters of the variation spectrum. Calculations were carried out for geomagnetic latitudes 50° and 0°. The comparison of experimental data with theoretical ones shows that the spectrum of the electrical field type yields the best agreement. Although the existence of an interplanetary electrical field is not very probable, the question of modulation of intensity by the heliocentric field remains still open. There are 2 tables.

TITLE: On the spectrum of variations during the Forbush effect

PERIODICAL: Referativnyy zhurnal, Geofizika, no.8, 1962, 11, abstract 8 G 84. (Izv. Krymsk. astrofiz. observ., v.27, 1962, 182-193)

TEXT: Reports calculations of the relations between cosmic-ray variations at different recording instruments during a Forbush effect. Three types of spectra are considered:

1) $(1/\pi)\cos^{-1}(1 - P_o/P)$; 2) $\delta D/D = P_o/P$; and 3) the spectrum of variations appearing under the action of an electric field. Comparison of the results with published experimental data shows that the spectrum of the form P_o/P is not in agreement with these data. The best agreement is obtained for the spectrum of the electric-field type.

TITLE: Connection between the characteristics of the Forbush effect and chromospheric flares

SOURCE: Akademiya nauk SSSR. Krymskaya astrofizicheskaya observatoriya. Izvestiya. v. 28. 1962. 324 - 330

TEXT: IGY data and the results of other investigations are used to investigate the correlation between the Forbush effect and chromospheric flares. The surface of the Sun was divided into three zones (90°E - 10°E, 10°E - 10°W, 10°W - 90°W) in order to investigate the amplitude and duration of the Forbush effect on the flare coordinates. The average values of the Forbush-effect parameters were then found for each zone. Forbush effects unidentified with flares were assigned to the central zone, if they were large, and to the peripheral zone if they were small. This was done in such a way that the differences between the average characteristics of the zones were a minimum. It was found as a result of this procedure that the Forbush-effect parameters were independent of the coordinates of the flare (to within 20 - 25%). Next, an

Connection between ....

analysis was made of the relation between the flare duration and the amplitude of the decrease in the cosmic-ray intensity during the Forbush effect. It was found that flares of longer duration were more likely to give rise to a Forbush effect than flares of short duration. The correlation coefficient characterizing the connection between the amplitude of the Forbush-effect decrease and the duration of flares is of the order of 0.8 ± 0.14. In the case of magnetic storms occurring in close succession, the Forbush effect tends to become suppressed if the flares responsible for the successive storms do not occur in the same active regions.
There are 1 figure and 4 tables.

TITLE: Static functional device

SOURCE: Priborostroyeniye, no. 7, 1965, 15-16

TOPIC TAGS: function generator 25

ABSTRACT: The principle of operation is explained of a new function generator which produces all trigonometric functions of a phase-shift angle between two voltage vectors of the same frequency. The function generator is based on three multipliers which develop: (1) a scalar product of two voltage vectors, (2) a vector product of two voltage vectors, and (3) a scalar modulus product of two voltage vectors. An experimental model of a new 50-cps phase meter (FV-162) uses the above principle. Orig. art. has: 1 figure, 11 formulas, and 1 table.

TITLE: Mechanism of the diurnal variation in cosmic rays[12]

SOURCE: Ref. zh. Issledovaniye kosmicheskogo prostranstva. Otdel'nyy vypusk, Abs. 7.62.254

REF SOURCE: Izv. Krymsk. astrofiz. observ., v. 32, 1964, 56-66

TOPIC TAGS: cosmic ray measurement, particle, particle scatter, diurnal variation

TRANSLATION: A theory on the diurnal solar variation in cosmic rays, developed in 1955 by L.I. Dorman, is compared with experimental data obtained by the universal network of stations during the International Geophysical Year. The author points out that in order to coordinate a theory with experimentally obtained data, it is necessary to keep in mind two factors: 1) the redistribution of trajectories of cosmic ray particles in a geomagnetic field, leading to varied decreases in the variation amplitudes recorded at various geomagnetic latitudes. Thus, at the equator the decrease coefficient of the neutron monitor is 0.67 for the first harmonic, whereas it drops to 0.29 for the second harmonic of the diurnal solar variation; yet, at 70°
